	y in Our World				

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 60.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- Questions labelled with an asterisk (*) are ones where the quality of your written communication will be assessed
 - you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

Questions begin on next page.

Answer ALL questions

Some questions must be answered with a cross in a box \boxtimes . If you change your mind about an answer, put a line through the box \boxtimes and then mark your new answer with a cross \boxtimes .

Carbon dioxide

1	(a)	The Earth's early atmosphere contained larger amounts of water vapour and carbon dioxide than it does today.	
		Explain how the amounts of water vapour and carbon dioxide in the Earth's atmosphere decreased.	
			(2)
	(b)	Describe how the presence of carbon dioxide in the atmosphere helps to keep th Earth warm.	ie
		Earth Wallin.	(1)
	(c)	State a human activity, apart from burning fuels, that has increased the percentage carbon dioxide in the atmosphere.	
			(1)

(d) This table shows a set of data for the percentage of carbon dioxide in the atmosphere and the mean surface temperature of the Earth in the years 1960 and 2014.

year	percentage of carbon dioxide	mean surface temperature / °C
1960	0.0318	14.0
2014	0.0401	14.4

Suggest why this information does not prove that the increase in percentage of carbon dioxide alone has caused the increase in the mean surface temperature of the Earth.

(1)

- (e) Hydrogen can be used as a fuel for cars.
 - (i) State one advantage and one disadvantage of using a car which uses hydrogen as the fuel rather than a car which uses petrol as the fuel.

(2)

(ii) Write the word equation for the reaction between hydrogen and oxygen.

(1)

(Total for Question 1 = 8 marks)

Rocks

2	(a)	Granite is an igneous rock.	
		The size of crystals in granite vary.	
		Describe how a sample of granite which contains large crystals was formed.	(2)
			(2)
	(b)	Limestone and marble are natural forms of calcium carbonate.	
		Limestone is a sedimentary rock.	
		Marble is a metamorphic rock, formed from limestone.	
		Describe how marble is formed from limestone.	
			(2)
	(c)	Calcium carbonate is used to treat waste gases in coal-fired power stations.	
	(=)	Explain why calcium carbonate can be used in this way.	
		Explain why calcium carbonate can be used in this way.	(2)

(d) (i)	(i) When calcium carbonate is heated, it breaks down to form calcium oxide and carbon dioxide.				
	What type of reaction is this?				
	Pu	t a cross (⊠) in the box next to your answer.	(1)		
X	A	combustion			
X	В	decomposition			
\times	C	oxidation			
\times	D	precipitation			
(ii)		lcium oxide reacts with water to form calcium hydroxide, Ca(OH) ₂ . rite the balanced equation for the reaction between calcium oxide and wate	r. (2)		

(Total for Question 2 = 9 marks)

Acids and electrolysis

(a) Which of these substances is produced in the stomach to help digestion? Put a cross (⋈) in the box next to your answer.

(1)

- A calcium oxide
- **B** hydrochloric acid
- magnesium oxide
- **D** sulfuric acid
- (b) Nitric acid reacts with magnesium carbonate to form a salt, water and a gas.
 - (i) State the name of the salt formed in this reaction.

(1)

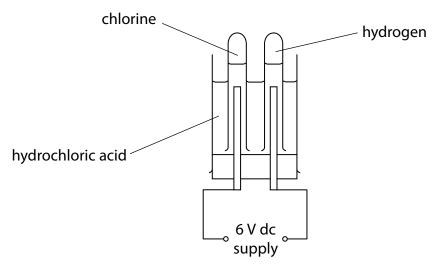

(ii) Which of these is the gas produced in this reaction? Put a cross (☒) in the box next to your answer.

(1)

- carbon dioxide
- hydrogen
- oxygen
- **D** nitrogen

(c) Hydrochloric acid is electrolysed using this apparatus. Hydrogen and chlorine are produced.

(i) Describe the test to show that a gas is chlorine.

(ii) Chlorine is a toxic gas.

State a safety precaution that should be taken when chlorine gas is formed in a reaction.

(1)

(iii) Write the balanced equation for the decomposition of hydrochloric acid to form hydrogen and chlorine.

(3)

(Total for Question 3 = 9 marks)

		Alkenes and polymers	
(a)	Coi	mplete the sentence by putting a cross (🛛) in the box next to your answer.	
		enes are	(1)
×		saturated carbohydrates	
X	В	saturated hydrocarbons	
X	C	unsaturated carbohydrates	
X	D	unsaturated hydrocarbons	
(b)) Pro	pene is an alkene and has the molecular formula C_3H_6 .	
()		Draw the structure of a propene molecule, showing all of the bonds.	
	(.,	bran are structure of a property more are, showing an or the bonds.	(2)
	(ii)	Propane is an alkane.	
	(11)	Propane and propene are both gases.	
		Given a sample of each gas, describe a test, carried out on both gases, to show	
		which gas is propane and which gas is propene.	(3)

(c) The diagram shows the structure of a tetrafluoroethene molecule.

Tetrafluoroethene can form the polymer PTFE.

(i) Draw a diagram to show part of a PTFE molecule formed from two tetrafluoroethene molecules.

(2)

(ii) PTFE does not allow other substances to stick to it. State a use of PTFE related to this property.

(1)

(d) Many polymers cause problems because they persist for a long time when they are put in landfill sites.

State an alternative way of disposing of polymer waste.

(1)

(Total for Question 4 = 10 marks)

Metals

5 (a) (i) Complete the sentence by putting a cross (⋈) in the box next to your answer.

(1)

Aluminium is extracted from aluminium oxide by electrolysis.

The overall equation for this reaction is

$$2Al_2O_3 \rightarrow 4Al + 3O_2$$

In this reaction

- A aluminium oxide is oxidised
- B aluminium oxide is reduced
- C aluminium metal is reduced
- **D** oxygen gas is oxidised
- (ii) Part of the reactivity series is shown

aluminium

most reactive

iron

lead

copper

least reactive

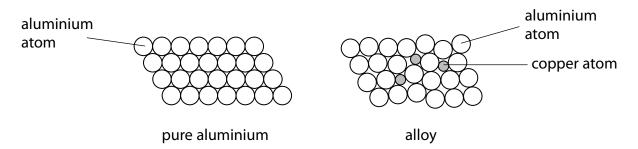

Lead is extracted from its oxide by heating the oxide with carbon rather than by using electrolysis.

Explain why.

(b) Pure aluminium is too weak for many uses. Copper can be mixed with aluminium to produce an alloy. The alloy is stronger than pure aluminium.

The diagrams show the structures of pure aluminium and the alloy.

Explain, in terms of these structures, how the presence of copper atoms in the alloy results in the alloy being stronger than pure aluminium.

(3)

*(C)) Iron in the form of steel, aluminium and copper are used to manufacture many useful articles.	
	These uses depend on their density, strength, electrical conductivity and resistance to corrosion.	
	Describe some uses of each of these metals in relation to their properties and the advantages of recycling these metals rather than extracting more of the metals	
	from their ores.	(6)

BLANK PAGE

Products from crude oil

- **6** Crude oil is separated into different fractions by fractional distillation.
 - (a) Fraction X is obtained from near the top of the fractionating column. Fraction Y is obtained from near the bottom of the fractionating column.

Which row of the table shows the boiling point, ease of ignition and viscosity of fraction X compared with fraction Y?

Put a cross (☒) in the box next to your answer.

(1)

	boiling point	ease of ignition	viscosity		
× A	lower than Y	more difficult than Y	higher than Y		
⊠ B	lower than Y	easier than Y	lower than Y		
⊠ C	higher than Y	more difficult than Y	lower than Y		
⋈ D	higher than Y	easier than Y	higher than Y		

(b) Pentane, C_5H_{12} , can be obtained from crude oil. When pentane burns completely in air, it forms carbon dioxide and water.

Write the balanced equation for this reaction.

(3)

(c) Sulfur is present as an impurity in some fuels.

Explain how the product of combustion of this impurity in a fuel can damage the environment.

(2)

*(d) The table below shows the percentages of three fractions obtained from crude oil and the percentages of these fractions required by customers.

fraction	number of carbon atoms in molecules	percentage obtained from crude oil	percentage required by customers
gases	1 to 4	2	5
petrol	5 to 10	10	26
kerosene	10 to 16	13	8

Oil companies use cracking to convert some of the molecules in the kerosene fraction into molecules with fewer carbon atoms.

Cracking can also be carried out on a small scale using liquid paraffin in a school laboratory.

Describe how cracking can be carried out in the laboratory experiment, explaining why it is necessary for oil companies to use cracking on some fractions obtained from crude oil.

You may wish to use diagrams to help parts of your answer.
